### Exploring Data

CSESS Seminar (7 Oct, 2021)

> Prepared by Raymond Wong Presented by Raymond Wong raywong@cse

**HKUST** 

#### Do you think that you could earn "US\$1 billion" by doing the gambling on the HK horse racing? Let me give some information to you.

If you are the single winner for the Triple Trio, you could obtain ~US\$13 million

There are more than 10 million combinations

What is the total number of times we need to be a single winner of Triple Trio?

= 1,000/13 = 76.92 = ~77

HKUST

#### Do you think that you could earn "US\$1 billion" by doing the gambling on the HK horse racing?

#### Bill Benter collected a lot of statistics about the "horse performance" in the past.

HKUST

#### He used some data analysis technology to predict the "next" horse racing result.

data analysis = US\$1 billion!

- We have just discussed one successful story of using data analysis.
- Let us discuss one more successful story of using data analysis.

They competed each other in March 2017. Finally, who won the game?

AlphaGo

#### AlphaGo collected a lot of statistics about the "GO player performance" in the past.

 It used some data analysis technology to predict the "next" move for each round in the game.

data analysis "wins" human!

#### Maybe, you are interested in why AlphaGo may win the game.

- Let us describe one basic game related to this.
- The details of AlphaGo may be known by you when you study some courses about data analysis.

- Suppose that Raymond has enough money and enough time for gambling.
- Consider that Raymond wants to do a gambling.
- The gambling game has only two possible outcomes, namely "large" (with probability = 0.5) and "small" (with probability = 0.5).
- Raymond could play the gambling game multiple times by always guessing that the outcome is "large".
- Is it always true that Raymond must earn money at the end with a "smart" strategy by playing a number of times of the gambling game?

- Suppose that Raymond has enough money and enough time for gambling.
- Consider that Raymond wants to do a gambling.
- The gambling game has only two possible outcomes, namely "large" (with probability = 0.3) and "small" (with some probabilities).
- Raymond could play the gambling game multiple times by always guessing that the outcome is "large".
- Is it always true that Raymond must earn money at the end with a "smart" strategy by playing a number of times of the gambling game?

Consider the following.

- For each round,
  - I should give \$1 to play the game
  - If I lose the game,
    - I will get \$0 (i.e., will lose \$1).
  - If I win the game,
    - I will get \$2 (i.e., will earn \$1).

#### What is the "expected" number of rounds that Raymond could earn \$1 when P(L) = 0.5?

The expected number of rounds = 1/0.5

= 2

- When P(L) = 0.5, is it always true that Raymond could earn \$1 after playing 2 rounds?
- When P(L) = 0.5, is it always true that Raymond could earn \$1 after playing 1000 rounds?

What is the "expected" number of rounds that Raymond could earn \$1 when P(L) = 0.3?

> The expected number of rounds = 1/0.3 =3.33

#### Do you think that the casino must lose?

No. In some casinos there are the following rules. 1. For each game, the player has a "minimum" amount of the money (e.g., \$100) for playing. This means that the player has to bring more money to the casino.

2. For each game, the player has a maximum amount of the money (e.g., \$1000) for playing. This means that the player could not play the game with a large amount of money.

#### Caution

- Each player may need to spend a lot of time (maybe, more than 1 day)
- Each player may need to spend a lot of money (more than what the player has).

Is it valuable to play a time-consuming game to win \$1?

- The probabilities (0.5 or 0.3) could be learnt from the past data using the data analysis technology
- No matter how "accurate" the probabilities could be learnt from the past data, Raymond must always win the game!

# This concept is NOT restricted to the gambling.

This could also be applied to the stock market for investment where "large" could be replaced by "up" and "small" could be replaced by "down".

# Now, we know two successful stories of using data analysis.

Next, let us see a case study of how to analyze data analysis.

## Singapore Taxis

- In Singapore, each taxi is equipped with a sensor.
- We know the path/trajectory of each taxi.
- We can collect the location of each taxi every second.
- There are a lot of points generated.

### Singapore Taxis

During rainy days, hard to find taxi in Singapore

- **EXPLANATION 1:** Taxis are slow to avoid accident
- DATA: GPS location of taxis are often on roadside; few cars are on the road
- **EXPLANATION 2:** Higher customer need
- **DATA:** Taxi income drops significantly
- FACT: A Singapore law says that higher penalty is imposed for car accidents that happen in rain

# Let us see one more successful story of using social networks.

In 2007, nobody knew the top-secret of "The Wizarding World of Harry Potter" (i.e., building a theme park in Orlando).

The Marketing Manager of this project did not spend money on TV or other media for advertisement.

- 7 top fans of "Harry Potter" were invited to participate in a top-secret Webcast held at midnight on May 31, 2007.
- Finally, 350,000,000 knew this secret!
- 7 = 350,000,000!!

#### Finding "Good" People for Marketing

**Objective:** to find a **limited** number of people for marketing in order to "influence" as many people as possible at the end

### **Other Applications**

#### Ice Bucket Challenge

#### Next, let us see a list of data analysis topics.

- 1. Association
- 2. Clustering
- 3. Classification
- 4. Data Warehouse
- 5. Web Databases

### 1. Association

Customer	Apple	Orange	Milk
Raymond	Apple	Orange	
Ada		Orange	Milk
Grace	Apple	Orange	

We are interested in the items/itemsets with frequency >= 2

### 1. Association

4

Customer	Annle		Orange	Milk				
Customer		-	Utalige	PHIK	We are interested in			
Raymond	Apple	j	Orange		the items/itemsets			
Ada			Orange	Milk	with frequency $>= 2$			
Grace	Apple		Orange					
				1. Apple	$\rightarrow$ Orange			
Items/Ite	msets	Fre	equency	( 100%) apple wil	100% customers who buy			
Apple	2			probably buy orangely				
Orange	3	*******	2 Orang	$e \rightarrow Annle$				
Milk		1			(67%) customer who buy orange will probably buy apple.)			
{Apple, Ora	nge}	2	**************************************	orange w				
Problem: to find all frequent patterns and association rules								

### 1. Association

#### Applications of Association Rule Mining

- Supermarket
- Web Mining
- Medical analysis
- Bioinformatics
- Network analysis (e.g., Denial-of-service (DoS))
- Programming Pattern Finding

- Association
   Clustering
- 3. Classification
- 4. Data Warehouse
- 5. Web Databases

# 2. Clustering

## Clustering for Understanding

- Applications
  - Biology
    - Group different species
  - Psychology and Medicine
    - Group medicine
  - Business
    - Group different customers for marketing

# 3. Classification

Suppose there is a person.

Race	Income	Child	Insurance
white	high	no	?

## **Applications**

## Insurance

- According to the attributes of customers,
  - Determine which customers will buy an insurance policy

## Marketing

- According to the attributes of customers,
  - Determine which customers will buy a product such as computers
- Bank Loan
  - According to the attributes of customers,
    - Determine which customers are "risky" customers or "safe" customers

## Applications

- Network
  - According to the traffic patterns,
    - Determine whether the patterns are related to some "security attacks"
- Software
  - According to the experience of programmers,
    - Determine which programmers can fix some certain bugs

# Applications

- We could have a more "general" application.
- It is NOT just to determine whether something is related to "yes" or "no".
- E.g., Automatic Image Caption Generation

A person riding a motorcycle on a dirt road.

A group of young people playing a game of frisbee.

A herd of elephants walking across a dry grass field.

**Describes without errors** 

Two dogs play in the grass.

Two hockey players are fighting over the puck.

A close up of a cat laying on a couch.

**Describes with minor errors** 

A skateboarder does a trick on a ramp.

A little girl in a pink hat is blowing bubbles.

A red motorcycle parked on the

A dog is jumping to catch a frisbee.

A refrigerator filled with lots of food and drinks.

A yellow school bus parked in a parking lot.

## We have illustrated a list of major topics in data analysis

 Next, let me illustrate 2 recent research papers from me. Which apartment should Raymond buy?

Suppose that user Raymond wants to buy an apartment

If the value is larger, then it is better to a user. One example is the apartment size.

There are 2 popular queries for this problem.

Top-k queries

Skyline queries

In this talk, we will talk about a new type of queries.

k-regret queries

ט ע	Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>
	p <sub>1</sub>	0	1
	p <sub>2</sub>	0.2	1
	p <sub>3</sub>	0.6	0.9
	p <sub>4</sub>	0.9	0.6
	p₅	1	0.2
	p <sub>6</sub>	1	0

### Suppose that user Raymond wants to buy an apartment

Top-k queries

Apartment	X <sub>1</sub>	X <sub>2</sub>
p <sub>1</sub>	0	1
p <sub>2</sub>	0.2	1
p <sub>3</sub>	0.6	0.9
p <sub>4</sub>	0.9	0.6
p <sub>5</sub>	1	0.2
p <sub>6</sub>	1	0

Top-k queries

- Suppose that user Raymond wants to buy an apartment
- Assume that Raymond has a "known" utility function.
- Utility function f  $f(p) = 0.3 X_1 + 0.7 X_2$
- Utility vector u = (0.3, 0.7)
- Suppose that we want to find the top-1 apartment.

### Output

Maximum utility point of D =

Advantage: The output size is "fixed"

Disadvantage: We need to know the "exact" utility function of Raymond

D	Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>	Utility
	<b>p</b> <sub>1</sub>	0	1	0.7
	p <sub>2</sub>	0.2	1	0.76
	p <sub>3</sub>	0.6	0.9	0.81
	p <sub>4</sub>	0.9	0.6	0.69
	p <sub>5</sub>	1	0.2	0.44
<b>D</b> 3	p <sub>6</sub>	1	0	0.3

Top-k queries

Suppose that user Raymond wants to buy an apartment

## My previous work

 k-Hit Query: Top-k Query with Probabilistic Utility Function (SIGMOD 2015) Which apartment should Raymond buy?

Suppose that user Raymond wants to buy an apartment

If the value is larger, then it is better to a user. One example is the apartment size.

There are 2 popular queries for this problem.

Top-k queries

Skyline queries

In this talk, we will talk about a new type of queries.

k-regret queries

ע כ	Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>	
	<b>p</b> <sub>1</sub>	0	1	
	p <sub>2</sub>	0.2	1	
	p <sub>3</sub>	0.6	0.9	
	p <sub>4</sub>	0.9	0.6	
	p₅	1	0.2	
	p <sub>6</sub>	1	0	

### Suppose that user Raymond wants to buy an apartment

Skyline queries

Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>
<b>p</b> <sub>1</sub>	0	1
p <sub>2</sub>	0.2	1
p <sub>3</sub>	0.6	0.9
p <sub>4</sub>	0.9	0.6
p <sub>5</sub>	1	0.2
p <sub>6</sub>	1	0

Suppose that user Raymond wants to buy an apartment

- There is no assumption that we know the "exact" utility function of Raymond
- There is a concept called "dominance"  $p_2$  dominates  $p_1$  because (1) the  $X_1$  value of  $p_2$  is better than that of  $p_1$ . (2) the  $X_2$  value of  $p_2$  is equal to that of **p**<sub>1</sub>.

D	Apartment	<b>X</b> 1	<b>X</b> <sub>2</sub>
	p <sub>1</sub>		
	p <sub>2</sub>	0.2	1
	p <sub>3</sub>	0.6	0.9
	p <sub>4</sub>	0.9	0.6
	p <sub>5</sub>	1	0.2
	p <sub>6</sub>	1	0

Suppose that user Raymond wants to buy an apartment

 There is no assumption that we know the "exact" utility function of Raymond

Suppose that user Raymond wants to buy an apartment

- There is no assumption that we know the "exact" utility function of Raymond
- There is a concept called "dominance"
- Apartments are called skyline apartments if they are not dominated by any other apartments

#### Output

Skyline apartments = { $p_2$ ,  $p_3$ ,  $p_4$ ,  $p_5$ }

Advantage: There is no need to specify the utility function of Raymond

Disadvantage: The output size is uncontrollable.

Suppose that user Raymond wants to buy an apartment

 Consider that Raymond has a utility function with the utility vector (0.3, 0.7).

- Suppose that the whole dataset is seen by user Raymond.
  - We could find his favorite apartment p<sub>3</sub> (Raymond's maximum utility point) 0.81

D	Apartment	X <sub>1</sub>	X <sub>2</sub>	l	Jtilit	ТУ	
	p <sub>1</sub>	0	1		0.7	,	
	p <sub>2</sub>	0.2	1		0.7	6	
	p <sub>3</sub>	0.6	0.9		0.8	1	1
	p <sub>4</sub>	0.9	0.6		0.6	9	
	₽ <sub>5</sub>	1	0.2		0.4	4	
	p <sub>6</sub>	1	0		0.3	3	

Suppose that user Raymond wants to buy an apartment

 Consider that Raymond has a utility function with the utility vector (0.3, 0.7).

**Problem (k-regret):** Given a set D, we want to find a set S of k points such that the mrr of S is minimized.

Advantage: The output size is "fixed"

k-regret queries

Advantage: There is no need to specify the Suppose that user utility function of Raymond

Consider that Raymond has a utility function with the utility vector (0.3, 0.7).

- Raymond's Regret Ratio = 0.06173
- There are many other users (e.g., Mary and Peter).
- Each of them has different utility functions.
- E.g., Mary's Regret Ratio = 0.05120E.g., Peter's Regret Ratio = 0
- Maximum Regret Ratio (mrr) = the maximum of all regret ratios (among (all users) (e.g., 0.06173) HKUST

Suppose that user Raymond wants to buy an apartment

### Next, let us give some details.

**Problem (k-regret):** Given a set D, we want to find a set S of k points such that the mrr of S is minimized.

k-regret queries

Suppose that user Raymond wants to buy an apartment

 Consider that Raymond has a utility function with the utility vector (0.3, 0.7).

		Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>
		p <sub>1</sub>	0	1
	Which one is better?	p <sub>2</sub>	0.2	1
		p <sub>3</sub>	0.6	0.9
	1. $p_2$	p <sub>4</sub>	0.9	0.6
	2. P3	р <sub>5</sub>	1	0.2
γ μ <sub>3</sub>		p <sub>6</sub>	1	0
Raymond	After this round,			
HKUST	preference better.			

**Problem (k-regret):** Given a set D, we want to find a set S of k points such that the mrr of S is minimized.

k-regret queries

Suppose that user Raymond wants to buy an apartment

 Consider that Raymond has a utility function with the utility vector (0.3, 0.7).

		Apartment	X <sub>1</sub>	<b>X</b> <sub>2</sub>	
		p <sub>1</sub>	0	1	
	Which one is better?	p <sub>2</sub>	0.2	1	
		p <sub>3</sub>	0.6	0.9	
	1. $p_4$	p <sub>4</sub>	0.9	0.6

## **Demo System**

- We developed a demo system on a car database with the following attributes
  - Price
  - Year
  - Power
  - Used km

#### Find Your Favorite!

This is a demostration system for finding your favorite car in a used car database. Enter your acceptable range for each attribute (leave blank to use the default). You will be presented two cars each time and you need to choose the one you favor more. Click the "Start" button to find your favorite car in the database!

Attribute	Smallest Acceptable Range	Greatest Acceptable Range
Price (USD)	1000	50000
Year	2001	2017
Power (PS)	50	400
Used KM	10000	150000
Max No. of Cars	1000	Mode ● Simplex ● Random
	Start	

## Your Choice

#### Q1: Choose the Car You Favor More among the Following Options

# Raymond keeps choosing one of the two choices.

Finally, he obtains the following answer.

# Conclusion

- We have illustrated a lot of applications how using data "smartly" could improve our life.
- We have illustrated some common topics in data analysis
- We have illustrated some of our recent papers.
