

A panoramic view of the Hong Kong skyline at night, featuring numerous illuminated skyscrapers and mountains in the background. The lights from the buildings reflect on the water in the foreground.

# TravelApp

**Loreen Wong**

**Advised by Prof. Fred Lochovsky**

# Introduction

It has been found that there are no applications that create itineraries for users. Applications available are split to providing attraction information as a data storage application or a timetabling application that the user fills in themselves.

TravelApp consists of 3 focal points:

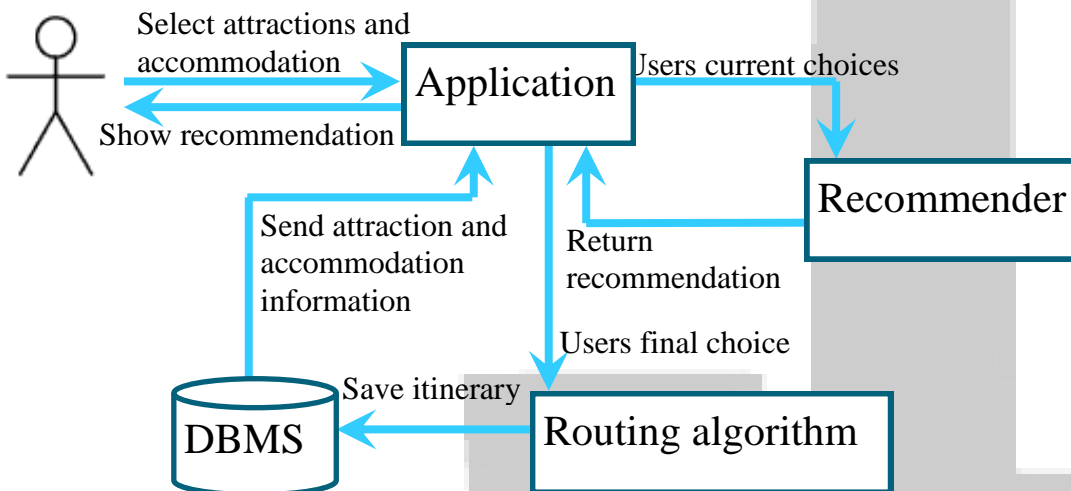

**Recommender:** Recommends attractions and accommodations based on attractions the user has already selected

**Itinerary Creation:** Creates itinerary visiting as many attractions as possible while reducing travel time

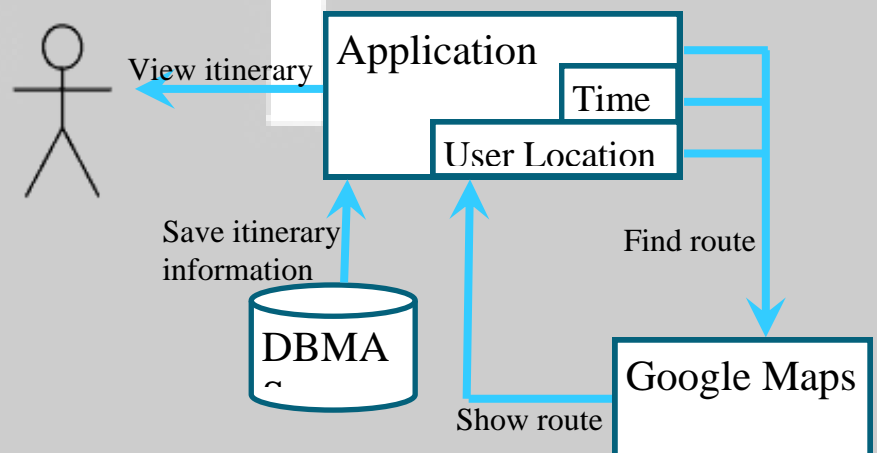

**Itinerary View:** Allows the user to view the itinerary and see the attractions they have/will visit on a map.

# Design

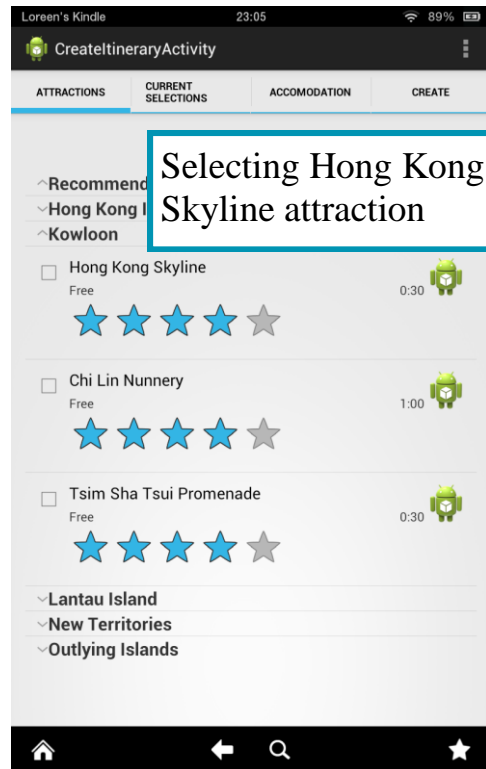

## Creating itinerary

## Viewing itinerary

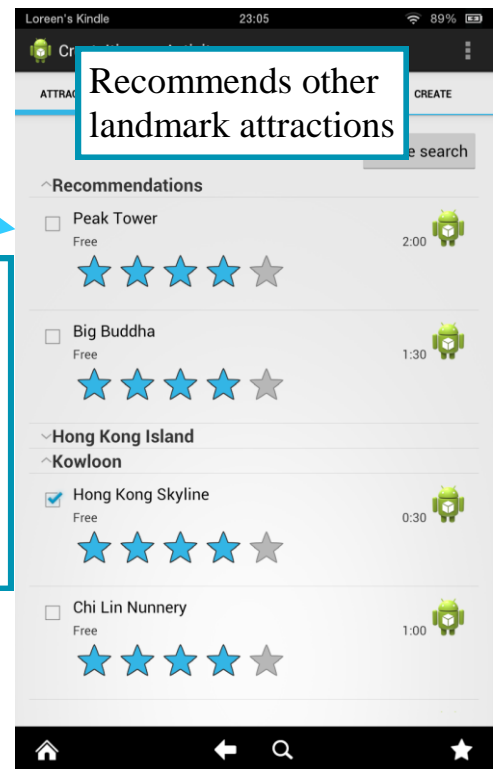

# Implementation

Selecting Hong Kong Skyline attraction

Recommender uses selected attraction categories. i.e, landmark, observation tower/deck, museum, amusement, etc and finds other non-selected attractions with the same categories.

## Recommender

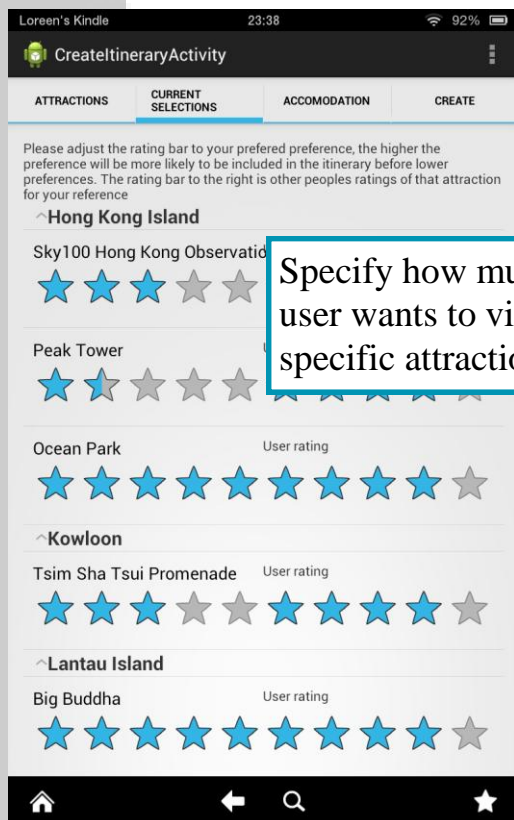

Recommends other landmark attractions

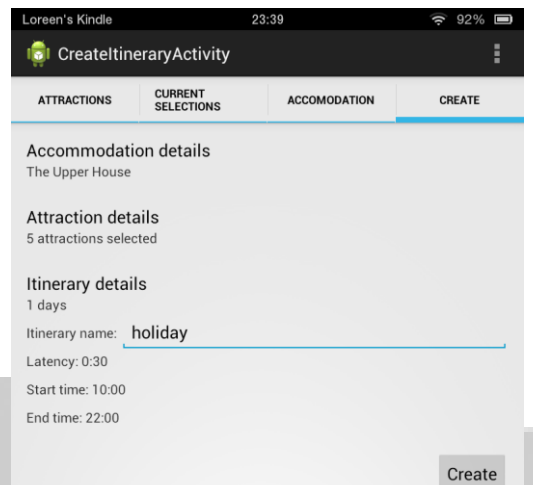

Accommodation recommender selects closest hotels based on the average location of the selected attractions.

## Itinerary creation

Bin sort sorts from an ordered list of attractions based on user preference. Each bin is a day with weighted attractions based on the attraction visit time. Another weight is added which is the travel time between attraction and the previous location.

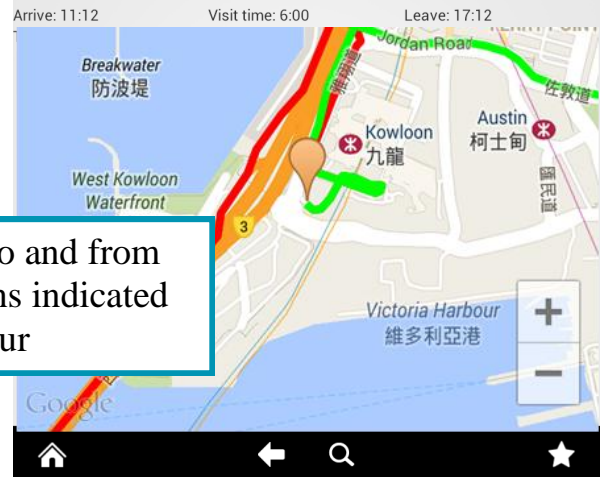

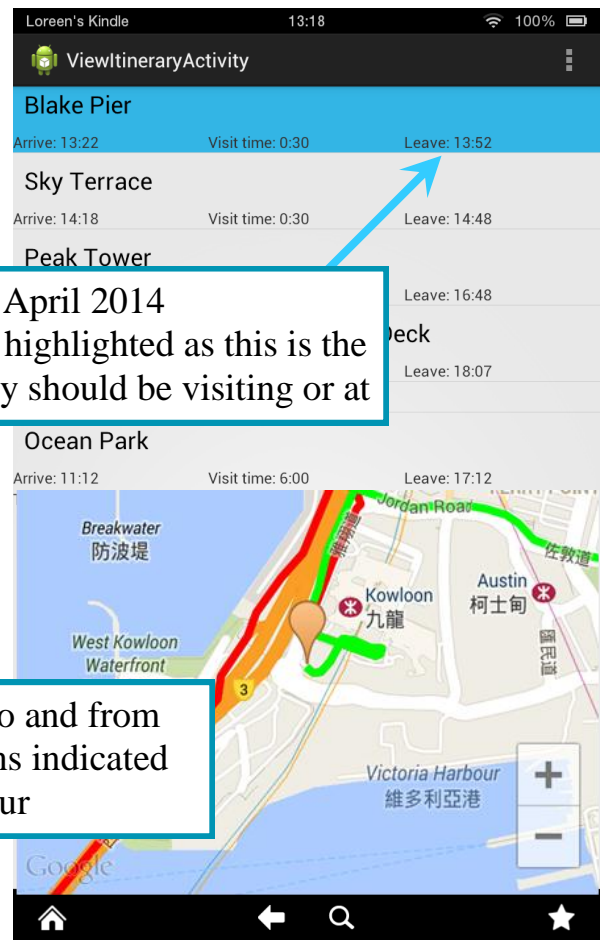

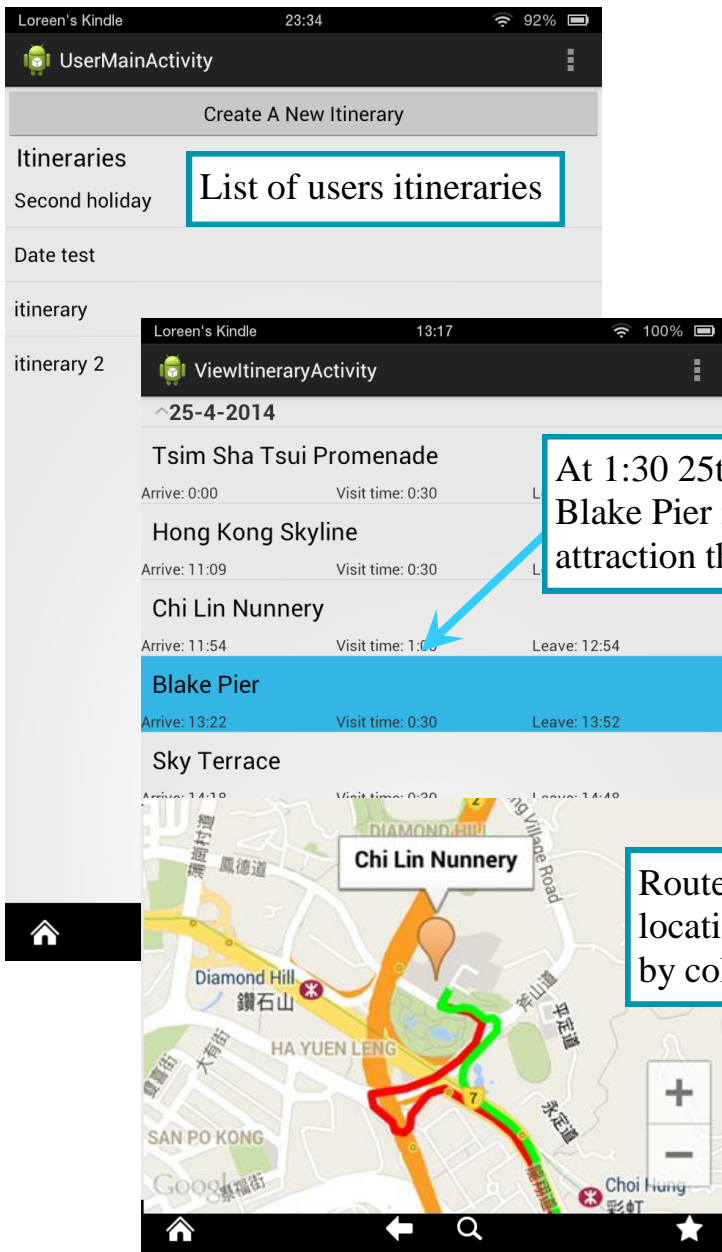

Specify how much the user wants to visit specific attractions

Confirm and fill in information:

- Start and end time for each day
- Itinerary name

## View Itinerary

## Conclusion

During this project, a unique android application has been created to help tourists create their own personalised itineraries which they can carry with them during their travels.

### Further improvements:

- Use of data mining to collect data sensibly for the application
- Adding meal breaks in the itinerary, account for users needing to eat during the day
- Recommend restaurants similar to accommodation but based on user location

### TravelApp Future Possibilities

If this application were to continue to develop, in the future it would allow travel worldwide and include multiple methods of transport including flights. An itinerary could have multiple accommodation selections and allow the user to travel to multiple countries in one itinerary.
